

Bar segments: identity of the source copy to its most similar directly aligned copy (* over the aligned segment, which covers $\geq 50\%$ of the shorter copy)

< 98% 98–99% 99–99.5% 99.5–100% 100%* over the aligned segment

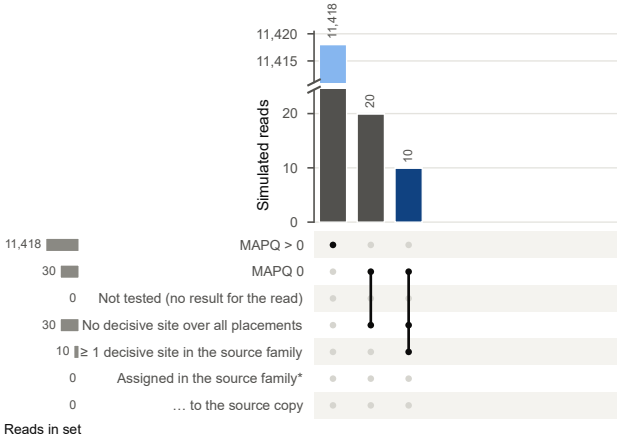

a Human A119b (CHM13 v2.0), chr16 catalog: 28,453 simulated reads

b Human testis (testis, CHM13 v2.0), genome-wide catalog

not run yet

c Gorilla OR6737 (testis, mGorGor1), chr20 (NC_073244.2) catalog: 11,448 simulated reads

d Gorilla KB3781 (fibroblast, mGorGor1), genome-wide catalog

not run yet

e Chimpanzee (mPanTro3), genome-wide catalog

not run yet

f Orangutan (mPonPyg2), genome-wide catalog

not run yet

* Assigned within the read's source family, known only in simulation. Columns beyond the 12 largest are pooled as 'other'.
